

**Title:** Like two strangers: Quantum Mechanics and General Relativity

**Speaker:** Professor Jose Edelstein  
Universidad de Santiago de Compostela  
Spain

**Abstract:** General Relativity just turned 100 years old. Quantum Mechanics is 10 years younger. They both enjoy excellent health and, together, have produced a prolific offspring of black holes that populate the Universe, which is also their child. They hold irreconcilable differences and yet, they are condemned to understand each other. At what price?
