Title: Gravitation and Dynamical Projective Connections

Abstract:

In 2D, Einstein’s theory of general relativity becomes trivial. Yet when one studies the symmetries of 2D through string theory, a new field, dubbed the diffeomorphism field, arise from the algebra of reparameterization. We show that this field has meaning in higher dimensions through the ubiquitous notion of geodesics and projective connections. By using the Thomas-Whitehead connection, which is a natural connection for projective geometry, we construct an action that gives the diffeomorphism field dynamics in the accompaniment of the Einstein-Hilbert action. From there we are able to describe how this field augments gravitational interactions with fermions, its relationship to symmetry and how it might be a component of dark energy and dark matter in 4D.
